Cybersecurity Morgenreport

Ausgabe: 20231116

Editorial

Guten Morgen,

willkommen zum Cybersecurity Morgenreport von Cyberwald, Ihrem täglichen Begleiter in der Welt der IT-Sicherheit. Als nicht-kommerzielles Projekt ist es unser Anliegen, Awareness und Wissen rund um das Thema Cybersecurity kostenlos zu vermitteln. In der heutigen digitalen Welt ist es für Unternehmen von entscheidender Bedeutung, sich über aktuelle Sicherheitsrisiken zeitnah zu informieren. Cyberbedrohungen entwickeln sich ständig weiter und können erhebliche Schäden verursachen, wenn sie nicht rechtzeitig erkannt und abgewehrt werden. Durch die Nutzung aktueller Informationen können Unternehmen ihre IT-Sicherheitsmaßnahmen stärken und sich effektiv gegen diese Bedrohungen schützen.

Unser Ziel ist es, Ihnen, den IT-Verantwortlichen, einen kompakten und leicht verständlichen Überblick über aktuelle Sicherheitsrisiken zu geben. Wir präsentieren Ihnen täglich Sicherheitsmeldungen und Berichte über neue Sicherheitslücken, die Ihre Systeme und Daten bedrohen könnten.

Darüber hinaus listen wir aktuelle Cyberangriffe und Ransomware-Vorfälle auf. Dies ist von besonderer Bedeutung, da es Unternehmen ermöglicht, sich auf mögliche Supply-Chain- und Phishing-Angriffe vorzubereiten. Durch das Verständnis der Methoden und Taktiken, die von Cyberkriminellen verwendet werden, können Unternehmen ihre Verteidigungsmaßnahmen entsprechend anpassen und stärken.

Für den Cybersecurity Morgenreport greifen wir automatisiert auf öffentliche Informationsquellen zu, filtern und sortieren diese Informationen, um sie Ihnen in einer übersichtlichen Form zur Verfügung zu stellen. Wir bemühen uns, die Inhalte so verständlich wie möglich zu gestalten und vorzugsweise vollständig in deutscher Sprache wiederzugeben. Bei Bedarf übersetzen wir die öffentlichen Informationen und fassen sie durch eine KI zusammen.

Der Cybersecurity Morgenreport ist ein dynamisches Projekt. Wir passen und erweitern unsere Inhalte ständig, um Ihnen die relevantesten und aktuellsten Informationen zu liefern. Derzeit befinden wir uns im Alpha-Stadium des Projekts und freuen uns über Ihr Feedback und Ihre Anregungen.

Wir hoffen, dass der Cybersecurity Morgenreport Ihnen hilft, Ihre IT-Sicherheitsmaßnahmen zu verbessern und Ihre Systeme vor den ständig wechselnden Bedrohungen zu schützen. Bleiben Sie sicher und informiert mit dem Cybersecurity Morgenreport von Cyberwald.

Ihr Cyberwald-Team

Sicherheitslücken

Eine Sicherheitslücke oder Schwachstelle ist ein Fehler in einer Software oder Hardware, der es einem Angreifer ermöglicht, in ein Computersystem einzudringen und Schaden anzurichten. Diese Lücke stellt eine Bedrohung für die Sicherheit des Systems dar, da sie ausgenutzt werden kann, um das System zu kompromittieren. Sicherheitslücken entstehen oft durch unzureichenden Schutz des Computers vor Netzwerkangriffen, zum Beispiel durch fehlende Firewall oder andere Sicherheitssoftware. Auch Programmierfehler im Betriebssystem, Webbrowser oder anderen Anwendungen können Sicherheitslücken verursachen. Bekannte Sicherheitslücken sollten daher so schnell wie möglich durch das Einspielen eines Patches geschlossen werden, um die Angriffsfläche der IT-Systeme zu verringern.

EPSS

Das Exploit Prediction Scoring System wird für eine bekannte Software-Sicherheitslücke / CVE auf einer Skala von 0 (0%) bis 1 (100%) angegeben und soll die Wahrscheinlichkeit für das Auftreten eines Exploits in naher Zukunft darstellen. Ein höherer Wert bedeutet eine höhere Wahrscheinlichkeit, dass eine Schwachstelle in naher Zukunft ausgenutzt wird. EPSS kann auch als Rahmen für die Priorisierung von Schwachstellen unter Verwendung einer Kombination von Metriken betrachtet werden. Es soll Unternehmen dabei helfen, ihre Ressourcen effizienter zu verteilen und alle relevanten Cyber-Risiken zu minimieren.

AjaxPro Deserialization Remote Code Execution

This Metasploit module leverages an insecure descrialization of data to get remote code execution on the target OS in the context of the user running the website which utilized AjaxPro. To achieve code execution, the module will construct some JSON data which will be sent to the target. This data will be descrialized by the AjaxPro JsonDescrializer and will trigger the execution of the payload. All AjaxPro versions prior to 21.10.30.1 are vulnerable to this issue, and a vulnerable method which can be used to trigger the descrialization exists in the default AjaxPro namespace. AjaxPro 21.10.30.1 removed the vulnerable method, but if a custom method that accepts a parameter of type that is assignable from ObjectDataProvider (e.g. object) exists, the vulnerability can still be exploited. This module has been tested successfully against official AjaxPro on version 7.7.31.1 without any modification, and on version 21.10.30.1 with a custom vulnerable method added.

F5 BIG-IP TMUI AJP Smuggling Remote Command Execution

This Metasploit module exploits a flaw in F5's BIG-IP Traffic Management User Interface (TMU) that enables an external, unauthenticated attacker to create an administrative user. Once the user is created, the module uses the new account to execute a command payload. Both the exploit and check methods automatically delete any temporary accounts that are created.

MagnusBilling Remote Command Execution

This Metasploit module exploits a command injection vulnerability in MagnusBilling application versions 6.x and 7.x that allows remote attackers to run arbitrary commands via an unauthenticated HTTP request. A piece of demonstration code is present in lib/icepay/icepay.php, with a call to an exec(). The parameter to exec() includes the GET parameter democ, which is controlled by the user and not properly sanitised/escaped. After successful exploitation, an unauthenticated user is able to execute arbitrary OS commands. The commands run with the privileges of the web server process, typically www-data or asterisk. At a minimum, this allows an attacker to compromise the billing system and its database.

F5 BIG-IP TMUI Directory Traversal / File Upload / Code Execution

This Metasploit module exploits a directory traversal in F5's BIG-IP Traffic Management User Interface (TMUI) to upload a shell script and execute it as the Unix root user. Unix shell access is obtained by escaping the restricted Traffic Management Shell (TMSH). The escape may not be reliable, and you may have to run the exploit multiple times. Versions 11.6.1-11.6.5, 12.1.0-12.1.5, 13.1.0-13.1.3, 14.1.0-14.1.2, 15.0.0, and 15.1.0 are known to be vulnerable. Fixes were introduced in 11.6.5.2, 12.1.5.2, 13.1.3.4, 14.1.2.6, and 15.1.0.4. Tested against the VMware OVA release of 14.1.2.

Splunk edit_user Capability Privilege Escalation

Splunk suffers from an issue where a low-privileged user who holds a role that has the edit_user capability assigned to it can escalate their privileges to that of the admin user by providing a specially crafted web request. This is because the edit_user capability does not honor the grantableRoles setting in the authorize.conf configuration file, which prevents this scenario from happening. This exploit abuses this vulnerability to change the admin password and login with it to upload a malicious app achieving remote code execution.

phpFox 4.8.13 PHP Object Injection

phpFox versions 4.8.13 and below have an issue where user input passed through the "url" request parameter to the /core/redirect route is not properly sanitized before being used in a call to the unserialize() PHP function. This can be exploited by remote, unauthenticated attackers to inject arbitrary PHP objects into the application scope, allowing them to perform a variety of attacks, such as executing arbitrary PHP code.
